Summary

Software Engineer with **4.6 years** of experience building **distributed systems** and **microservices** in Java & Python across AWS, GCP, and Azure. Delivered a **5x infrastructure cost reduction** through database consolidation and cloud migration, and led a production go-live with **99.999%** system availability. Experienced across the stack with Spring Boot, Quarkus, Kubernetes, Docker, SQL, and NoSQL database

Experience

Senior Software Engineer (*Blue Yonder / Bengaluru*)

May 2025 – Present

- Cut Elasticsearch load **by 30%** and **costs by 40%** by building a **Go Fiber** Log export service **supporting files up to 10GB+** using HATEOAS based part links for large-file pagination and chunked streaming (via goroutines), **at 50 RPS with optimized p99 latency**
- Built REST APIs (handling ~60 RPS with optimized P95 latency via async, fire-and-forget provisioning triggers) for Cloud/Kubernetes provisioning, cutting deployment time by 70% and recovery time by 90%, with Keycloak OAuth 2.0 for user/machine auth & Postgres-based spec storage for recovery & deployment.
- Reduced manual setup effort by 80% and boosted productivity by 60% by building Python CLI tools (Poetry) that generate required files and resources for different runtimes with a single command.
- Standardized **release** system by building a versioned CI pipeline for Helm packaging and image builds.
- Cut **manual deployment work by 80%** by setting up GitOps pipelines(ArgoCD) and developing CRD(Kubebuilder) operators in Go to provision core, observability, and Azure resources.
- Resolved production incidents within a **4-hour SLA** as **L4 support**, debugging failures across APIs, Kubernetes resources, and Elasticsearch using logs and monitoring kibana dashboards & alerts.
- Built a service for 3rd party integration to collect OpenTelemetry with configurable **data sampling rates**.
- Implemented monitoring application for 13+ Azure resource types, 100+ subscriptions and MongoDB resources using Kubernetes, Helm, and Elastic Agent, improving resource health visibility.
- Cut system **backpressure by 80%** and improved reliability by building a **distributed** telemetry pipeline with Logstash/OTel collectors deployed across multiple k8s clusters and runtimes using a repeatable template (cookie cutter), integrated with Kafka to handle 80K events/sec with PII masking at 60% accuracy.
- Achieved **95% test coverage** across Python CLI, FastAPI, and Go Fiber services using Pytest and Behave, reducing regression defects in production.
- Maintained documentation, FAQs & troubleshooting runbooks used by 1k+ developers across the org.

Software Developer (*Quantiphi / Bengaluru*)

July 2022 – April 2025

- Developed a **B2B** application using hybrid **microservices architecture(Quarkus/Spring Boot)** to replace a **SaaS cloud banking platform** with a focus on reliability, scalability, & cost optimization, saving clients around **\$250K/pa**.
- **Architected** core services **disbursement, loan, and customer management** from scratch(handling ~200 RPS at the API layer with optimized P99 latency) by utilizing **microservice** and **Java design patterns, resulting in a 50% reduction in processing time and a 60% increase in loan disbursement**.
- Implemented critical systems, event-driven disbursement (API responds instantly, GCP Pub/Sub triggers the service asynchronously), idempotency via a loan-ID keyed table, JWT auth, RBAC, scheduled jobs, cache management & audit logging, cutting duplicate transactions by 40% & response time by 20%.
- Achieved 85% test coverage across Quarkus/Spring Boot microservices using **JUnit, Mockito, & Testcontainers**, reducing production defects.
- Took the end-to-end production go-live process, ensuring seamless deployment with **99.999% availability** and zero business disruption.
- Migrated 20+ Quarkus/Spring Boot microservices from **AWS** to **GCP** and consolidated 3 SQL/NoSQL databases into SingleStore(distributed DB), **reducing costs 5x** and improving scalability with Cloud Run.
- Designed and developed a **FastAPI**-based e-learning platform integrating Google Classroom, featuring scalable **microservices** for notification, user, and assignment management, deployed on **Kubernetes/Helm** with **Redis** caching with 1 hour TTL, **GCP Pub/Sub**, and BigQuery for analytics and reporting. [Link](#)
- **Led client interactions, Collaborated** with junior developers, conducted discussion, code review and created jira tickets using agile methodology.

SKILLS

- **Languages:** Java, Python, Golang, SQL
- **Frameworks:** Spring Boot, Quarkus, FastAPI, Fiber(Golang),Hibernate, JUnit, Mockito, Pytest, Poetry
- **Cloud Platforms:** AWS, GCP, Azure
- **Databases:** MySQL, SingleStore, Redis, BigQuery, Elasticsearch, NoSQL
- **DevOps & Infrastructure:** Docker, Kubernetes, Helm, GitOps, IaC, ArgoCD, CI/CD
- **Observability & Monitoring:** OpenTelemetry, Logstash, Kibana
- **Message Brokers:** Kafka, Google Pub/Sub
- **Core Competencies:** System Design, Distributed Systems, Multithreading, Design Patterns, Shell Scripting

EDUCATION

SKIT, Jaipur

Aug 2018 – July 2022

BTech in Computer Science and Engineering CGPA 8.0
